CLAIMS

What is Claimed is:

1. A method of performing admission control of traffic flow in an information network, comprising:

determining a first effective envelope associated with arriving traffic entering said network;

determining a second effective envelope associated with admitted traffic currently in said network;

determining a service curve by measuring departing traffic leaving said network; and

admitting said arriving traffic if the sum of the first and second global effective envelopes is less than or equal to said service curve.

- 2. The method of claim 1 wherein said first and second envelopes are global effective envelopes.
- 3. The method of claim 1 wherein said second envelopes is a global effective envelopes determined as a function of the measured average and variance of the aggregate traffic.
- 4. The method of claim 1 wherein said first and second envelopes are local effective envelopes.

- 5. The method of claim 1 wherein said second envelopes is a local effective envelopes determined as a function of the measured average and variance of the aggregate traffic.
- 6. The method of claim 1 wherein said first effective envelope is based on the aggregate of arriving traffic.
- 7. The method of claim 6 wherein said aggregate is determined by measuring an aggregate arrival flow at plural time intervals and by calculating the average and variance.
- 8. The method of claim 1 wherein and second effective envelope is recursively calculated.
- 9. The method of claim 1 wherein said service curve is determined based on measured packet delay.
- 10. The method of claim 1 wherein said service curve is determined by developing a list of pairs representing the amount of time required to service one packet of information and the number of backlogged packets of information and using said list to determine a bounded service envelope.

10

11. A method of performing admission control of traffic flow in an information system, comprising:

determining a first effective envelope associated with arriving traffic entering said network;

determining a second effective envelope associated with admitted traffic currently in said network;

determining a service curve by measuring departing traffic leaving said network; and

admitting said arriving traffic if the sum of the first and second global effective envelopes is less than or equal to said service curve.

- 12. The method of claim 11 wherein said information system is a multi-port switch.
- 13. The method of claim 11 wherein said information system is an autonomous network.
- 14. The method of claim 11 wherein said information system is a computer network domain.
